## Fun Fact

Worldwide Service Project - Finalists

### **Maternal and neonatal tetanus: UNICEF**

Maternal and Neonatal Tetanus (MNT) kills one baby every four minutes. MNT can abruptly turn the joy of new life into wrenching tragedy. Its effects are excruciating — tiny newborns suffer repeated, painful convulsions and become hypersensitive to light, sound and touch. Even a mother's soothing voice and comforting caress are unbearable for the infant. Few babies survive. Tetanus may claim the mother's life as well. In impoverished countries, where women have little access to health care, many are forced to give birth in an unsanitary environment. Tetanus spores are found everywhere — in the air, soil and contaminated objects. Bacteria can enter the mother's body through open wounds and pass through a newly cut umbilical cord. Once the baby is infected, a lethal toxin attacks his or her nervous system. Tetanus is highly preventable. Three doses of a vaccine can protect mothers and babies. The project would raise \$110 million to eliminate a deadly disease and save 129 million mothers and their future babies.
